## MEASURING YOUR SPRINKLER USAGE

1. Make sure all faucets are turned off inside and outside the home.
2. Read the meter and write the reading in section $A$ on the table below.
3. Turn on your sprinklers for a regular cycle (each cycle can be done separately to determine amount of water being used in each area).
4. When cycle is complete, read the meter and write the reading in section $B$ on the table below.
5. Subtract A from B and write the result in C.
6. Write the number of cycles your sprinklers activate per week in column D.
7. Multiply $C$ and $D$ and write the result in column $E$ (that is the number of cubic feet used per week).
8. Multiply E by 4 and write the result in column $F$ (this is the number of cubic feet used per month).
9. Divide $F$ by 100 and write the result in column $G$ (this is the number of units from your bill that are used to water your lawn).
